

Project case review

Technic-Control Sp. Z.o.o.

Technic-Control provides specialised NDT services to the shipbuilding, construction and oil & gas industries, and is aiming to become the leading provider of NDT technologies in Poland.

Based in Szczecin, Technic-Control's expertise covers all NDT technologies including conventional radiography; ultrasonic; dye penetrant; magnetic particle; and eddy current.

Filmfree and Technic-Control

Technic-Control contributed to Filmfree by performing development trials on the project's integral scanner/reader system and formal field trials on the fully developed system.

Project benefits

Technic-Control joined Filmfree to participate in the development of leading-edge NDT technology and to gain access to the growing digital radiography market.

The project has enabled the company to digitise its film radiographs in order to provide an improved service to customers who are now able to see their images online via the BAM ISee! application.

Additionally, Technic-Control is implementing a fully digital radiography system based on imaging plates.

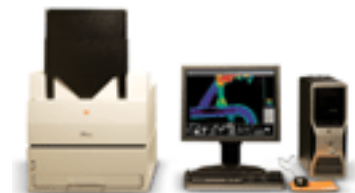

The future

The project has enabled Technic-Control to broaden their service offering, which now includes detection and testing of corrosion in pipework using digital radiography, generating significant interest in the petrochemical industry.

As a result of their involvement in the project and its uptake of digital radiography technology, the company has secured 200,000€ of sales with anticipated future contracts worth a further 300,000€. Moreover, one new job has been created to support this growth with an estimated three to follow.

NDT services across all sectors
